CAIO Training Program

Become a Chief AI Officer — Build, Sell & Scale AI Systems

By Agentik {OS} — Founded by Gareth Simono

> *"The future doesn't belong to people who use AI tools. It belongs to people who build AI systems."*

Program Overview

This training program teaches you everything you need to become a CAIO (Chief AI Officer) — the most in-demand role of 2026. You will learn to sell AI services, build production-grade AI systems, and connect powerful tools to create exponential value for businesses.

Three standalone courses. Each one is complète on its own. Together, they make you unstoppable.

Course	Focus	Price
Sales Mastery	How to sell yourself as a CAIO	$497
Systems Builder	Build AI systems with Claude Code & modern stack	$497
Tools Arbitrage	Connect & orchestrate AI tools for maximum leverage	$497
Full Bundle	All 3 courses + bonus resources	**$997** (save $494)

© 2026 CAIO Academy

Table of Contents

Part 1 — Sales Mastery: Become the CAIO

- Module 1: The CAIO Role — What It Is & Why It Matters
- Module 2: Positioning & Personal Branding
- Module 3: Finding & Qualifying Clients
- Module 4: The Sales Process — From First Contact to Close
- Module 5: Pricing Your Services
- Module 6: Building Recurring Revenue
- Module 7: Scaling Beyond Yourself

Part 2 — Systems Builder: Master AI Development

- Module 8: Claude Code Fundamentals
- Module 9: MCP Servers — The Universal Connector
- Module 10: Composio — Tool Integration Platform
- Module 11: Skills, Hooks & Commands
- Module 12: Cron Systems & Automation
- Module 13: Building SaaS with Next.js + Convex
- Module 14: Authentication with Clerk
- Module 15: Payments with Stripe
- Module 16: AI Agent Architecture
- Module 17: Production Deployment & DevOps

Part 3 — Tools Arbitrage: Connect, Orchestrate & Scale

- Module 18: The Arbitrage Mindset
- Module 19: High-Level Tool Connections
- Module 20: Building Custom Pipelines
- Module 21: Multi-Agent Orchestration
- Module 22: Monitoring & Self-Healing Systems
- Module 23: Client Delivery Framework
- Module 24: Scaling Your AI Business

Appendix

- A: Complète Tool Référence
- B: CAIO Business Templates

PART 1 — SALES MASTERY

How to Sell Yourself as a CAIO

> ***Price: $497*** *| 7 Modules | Estimated completion: 2-3 weeks*

This course transforms you from “someone who knows AI” into a CAIO that companies pay $4,000-15,000/month. You will understand the market, position yourself correctly, and close deals confidently.

© 2026 CAIO Academy

Module 1: The CAIO Role — What It Is & Why It Matters

1.1 What is a Chief AI Officer?

A CAIO (Chief AI Officer) is a strategic leader who integrates AI systems into a business to replace, augment, or optimize traditional operations. Unlike a CTO who manages human engineering teams, a CAIO orchestrates AI agents to deliver outcomes that previously required 5-20 people.

Key Responsibilities:

- Audit businesses for AI opportunities
- Design and implement AI agent systems
- Replace manual workflows with automated pipelines
- Manage AI tool selection and integration
- Provide strategic AI leadership to executives
- Deliver measurable ROI through AI adoption

1.2 Why the CAIO Role Exists Now

The convergence of three forces created this opportunity:

1. **AI models became production-ready** — Claude, GPT-4, Gemini can now reliably perform complex tasks
2. **Orchestration tools matured** — Claude Code, MCP, Composio make it possible to chain AI actions
3. **Cost arbitrage is massive** — A full tech team costs $300-700K/year. An AI system does the same work for $5-15K/month

1.3 The Market Opportunity

Traditional Role	Annual Cost	CAIO Replacement Cost	Savings
CTO + 3 Developers	$400-600K	$8-15K/month	70-85%
Marketing Team (4 people)	$250-400K	$5-10K/month	75-90%
QA Team (2 people)	$150-250K	$3-5K/month	80-90%
Full Tech Department	$600K-1.2M	$12-25K/month	75-85%

> ***Key insight:*** *Companies don't want to hire AI tools. They want someone who can orchestrate AI to produce results. That person is the CAIO.*

© 2026 CAIO Academy

1.4 CAIO vs. Other Roles

Role	Focus	Earns	Scalability
Freelance Developer	Writing code	$50-150/hr	Low — time-bound
AI Consultant	Giving advice	$200-500/hr	Medium — knowledge-bound
CAIO	**Building & running AI systems**	**$4-15K/month per client**	**High — system-bound**
Agency Owner	Managing humans	Variable	Medium — hiring-bound

The CAIO advantage: you build a system once, and it runs for the client continuously. Your income is not tied to your time.

© 2026 CAIO Academy

Module 2: Positioning & Personal Branding

2.1 Crafting Your CAIO Identity

Your positioning statement follows this formula:

> *"I help [TARGET AUDIENCE] achieve [SPECIFIC OUTCOME] using AI systems that replace [WHAT THEY CURRENTLY PAY FOR]."*

Examples:

- "I help SaaS startups launch MVPs in 3 weeks using AI agents that replace a $300K dev team."
- "I help e-commerce brands automate their marketing with AI systems that replace 4 marketing hires."
- "I help healthcare companies modernize their tech stack with AI that replaces a full IT department."

2.2 Building Your Online Presence

Must-have platforms (in priority order):

1. **LinkedIn** — Your primary sales channel

- Headline: "Chief AI Officer | I replace teams with AI systems | Founder @ [Company]"
- Post 3-5x/week about AI systems, results, and insights
- Connect with founders, CTOs, and decision-makers

1. **Personal Website** — Your credibility anchor

- Case studies with real numbers
- Clear service offerings with pricing
- Booking link for discovery calls

1. **Twitter/X** — Your thought leadership platform

- Build in public
- Share technical insights
- Engage with the AI builder community

1. **Telegram/Discord** — Your community

- Create a free channel for content
- Premium channel for paying clients/students

© 2026 CAIO Academy

2.3 Content Strategy for CAIO Authority

The 3-pillar content framework:

Pillar	Content Type	Example	Frequency
Show	Before/after results	“Replaced a 5-person QA team with MANIAC”	2x/week
Teach	How-to tutorials	“How to set up Claude Code for production”	2x/week
Tell	Industry insights	“Why 80% of dev agencies will die by 2027”	1x/week

2.4 Building a Portfolio from Scratch

If you have no clients yet:

1. **Build your own products** — Create 2-3 SaaS MVPs using the AI systems you’ll sell
2. **Offer free audits** — Audit 5 businesses for free, document everything
3. **Contribute to open source** — Build MCP servers, Claude Code skills, or automation tools
4. **Case study your own journey** — Document how you built your CAIO practice using AI

© 2026 CAIO Academy

Module 3: Finding & Qualifying Clients

3.1 Ideal Client Profile (ICP)

Your best clients share these characteristics:

Criteria	Ideal	Avoid
Company size	2-50 employees	500+ (too many stakeholders)
Revenue	$100K-$10M ARR	Pre-revenue (can't pay)
Tech team	0-5 people	20+ (political resistance)
Decision maker	Founder/CEO	Middle manager
Budget	$3K-15K/month	<$1K/month
Pain	"We need to move faster"	"We're just exploring"

3.2 Where to Find Clients

Active channels (you go to them):

- LinkedIn outreach (target founders posting about hiring struggles)
- Indie Hackers, Product Hunt, Y Combinator forums
- Local startup meetups and tech events
- Facebook/Reddit entrepreneur groups
- Cold email to companies posting developer job listings

Passive channels (they come to you):

- SEO-optimized blog content about AI systems
- YouTube tutorials on AI automation
- Podcast appearances
- Referral program with existing clients
- Telegram/Discord community

3.3 The Qualification Framework

Use the **BANT-AI** framework:

© 2026 CAIO Academy

Criteria	Question	Green Flag	Red Flag
Budget	“What’s your current tech spend?”	>$3K/month available	“We have no budget”
Authority	“Who decides on tech investments?”	“I do” (founder/CEO)	“I’ll need to ask my boss”
Need	“What’s your biggest operational bottleneck?”	Specific, urgent pain	“Just curious about AI”
Timeline	“When do you need this solved?”	“Yesterday” or “This quarter”	“Maybe next year”
AI-readiness	“What AI tools do you currently use?”	Some familiarity	“AI is just hype”

3.4 Outreach Templates

LinkedIn Connection Request:

> *“Hey [Name], I noticed you’re hiring a [developer/marketer/etc]. I help companies like [similar company] get that same output using AI systems at 1/5th the cost. Would a 15-min chat be worth your time?”*

> ***Cold Email Template:*** *Subject: [Company] + AI = 10x output at 1/10th cost*
>
> *Hi [Name],*
>
> *I noticed [Company] is [hiring for X / scaling Y / launching Z].*
>
> *I’m a CAIO (Chief AI Officer) who builds AI systems that replace traditional teams. My last client replaced a 4-person dev team with an AI system for $8K/month (vs $350K/year they were spending).*
>
> *Would a 15-minute call to explore if this makes sense for [Company] be worth your time this week?*
>
> *— [Your Name] CAIO | [Your Company]*

© 2026 CAIO Academy

Module 4: The Sales Process — From First Contact to Close

4.1 The CAIO Sales Pipeline

> *Discovery Call (30 min) → AI Audit Proposal → Audit Delivery → Retainer Proposal → Ongoing Partnership*

4.2 The Discovery Call Framework

Structure (30 minutes):

Phase	Duration	Purpose
Rapport	3 min	Build connection, show you understand their world
Pain discovery	10 min	Understand their biggest bottleneck
Current state	5 min	Map their existing tech/team/costs
Vision	5 min	Paint the picture of what's possible with AI
Proposal	5 min	Recommend the right starting point
Next steps	2 min	Book the follow-up, send proposal

Key questions to ask:

1. "What does your tech team look like today?"
2. "What are you spending annually on development/marketing/operations?"
3. "If you could wave a magic wand, what would you automate first?"
4. "What's the cost of NOT solving this problem in the next 6 months?"
5. "Have you tried using AI tools? What was the result?"

4.3 The Audit-First Approach

Always start with an audit. It's the lowest-risk entry point for both parties.

What the audit delivers:

- Complète map of AI opportunities in their business
- Prioritized implementation roadmap
- Cost-benefit analysis for each opportunity
- Technical feasibility assessment

© 2026 CAIO Academy

- 90-day action plan

Why audits convert to retainers:

- Client sees concrete, specific opportunities (not generic advice)
- Trust is built during the audit process
- ROI projections make the retainer decision obvious
- You understand their business deeply before proposing a retainer

4.4 Handling Common Objections

Objection	Response
“AI isn’t ready yet”	“Tell me which specific tasks you think AI can’t handle. I’ll show you real examples of each.”
“It’s too expensive”	“What are you spending now on [team/tools/outsourcing]? My system costs 1/5th of that.”
“We tried ChatGPT”	“That’s like comparing a calculator to an accounting department. I build systems, not prompts.”
“What if it doesn’t work?”	“We start with a $3K audit. If the opportunities aren’t there, you have a comprehensive report. Zero risk.”
“Can’t we do this ourselves?”	“You could. But would you rather spend 6 months learning, or have a production system in 3 weeks?”

© 2026 CAIO Academy

Module 5: Pricing Your Services

5.1 The CAIO Pricing Framework

Service	Price	Duration	Best For
AI Audit	$3,000-7,000	One-time (1-2 weeks)	New clients, low risk entry
AI Build	$15,000-45,000	One-time (3-8 weeks)	Specific product/system build
CAIO Partnership	$4,000-15,000/mo	Ongoing	Long-term AI leadership
Training Workshop	$2,000-5,000	1-2 days	Teams wanting to learn

5.2 Value-Based Pricing

Never price based on your time. Price based on what you replace.

The formula:

> *Your Price = (Client's Current Cost × 30%) to (Client's Current Cost × 50%)* ***Example:***

- Client spends $250K/year on a dev team
- Your AI system replaces 80% of that output
- Value created: $200K/year
- Your price: $60K-100K/year ($5K-8K/month)
- Client saves: $100K-140K/year

5.3 Packaging Tips

1. **Always offer three options** — Audit, Build, Partnership
2. **Anchor high** — Present the Partnership first, then the Build, then the Audit
3. **Bundle for value** — "Take all three courses for $997 instead of $1,491"
4. **Add urgency** — "I take 3 new partnership clients per quarter"
5. **Include guarantees** — "Full refund if the audit doesn't identify at least $50K in savings"

© 2026 CAIO Academy

Module 6: Building Recurring Revenue

6.1 The Retainer Model

The CAIO Partnership is your recurring revenue engine. Structure it as:

Tier	Monthly Fee	Included Hours	Scope
Advisory	$4,000	10h/month	Strategy + guidance
Hands-on	$8,000	20h/month	Strategy + implementation
Embedded	$15,000	40h/month	Full CAIO role + AI team

6.2 Retainer Deliverables

Monthly deliverables for each tier:

- Weekly AI system reports (automated)
- Monthly strategy review call (1h)
- Continuous system improvements
- New automation implementations
- Performance monitoring & alerts
- Priority support via Telegram/Slack

6.3 Client Retention Stratégies

1. **Make yourself indispensable** — Build systems only you can maintain
2. **Show ROI monthly** — “This month, your AI system saved you $X”
3. **Proactive improvements** — Don’t wait for requests; suggest optimizations
4. **Quarterly business reviews** — Align AI strategy with business goals
5. **Community access** — Include them in your CAIO community

---

© 2026 CAIO Academy

Module 7: Scaling Beyond Yourself

7.1 From Solo CAIO to CAIO Agency

The progression:

> *Solo CAIO ($10-20K/month) → CAIO + VA ($20-40K/month) → CAIO Team ($50-100K/month) → CAIO Academy ($100K+/month)*

7.2 Leverage Points

Strategy	Revenue Impact	Effort
Productize your audit	Sell self-service audit tool	Medium
Create templates	Sell AI system templates	Low
Build a course	$497-997 per student	Medium (one-time)
Affiliate program	33% recurring commissions	Low
White-label systems	License your AI systems	High

7.3 The CAIO Flywheel

> *Build AI Systems → Show Results → Attract Clients → Build More Systems → Create Templates → Sell Templates → Train Others → Build Community → Scale Infinitely*

© 2026 CAIO Academy

© 2026 CAIO Academy

PART 2 — SYSTEMS BUILDER

Build AI Systems with Claude Code & Modern Stack

> ***Price: $497*** *| 10 Modules | Estimated completion: 4-6 weeks*

This course teaches you to build the same AI systems we use at Agentik {OS} to serve our clients. You will master Claude Code, MCP servers, the full SaaS stack, and production deployment.

© 2026 CAIO Academy

Module 8: Claude Code Fundamentals

8.1 What is Claude Code?

Claude Code is Anthropic's official CLI tool for agentic AI development. It's the backbone of every CAIO's toolkit — a terminal-based interface where Claude can read, write, execute, and manage your entire codebase.

Why Claude Code over alternatives:

- Direct file system access (reads/writes/edits files natively)
- Tool use (can run bash commands, search code, manage git)
- Agent spawning (can launch sub-agents for parallel work)
- Memory system (persistent context across sessions)
- Hooks system (custom automation on tool events)
- Skills system (reusable, shareable capabilities)

© 2026 CAIO Academy

8.2 Installation & Setup

© 2026 CAIO Academy

```
# Install Claude Code
npm install -g @anthropic-ai/claude-code

# Authenticate
claude login

# Start a session in your project
cd ~/my-project
claude
> ### 8.3 Configuration
>
> **Key configuration files:**
>
> | File | Purpose | Scope |
> |------|---------|-------|
> | `~/.claude/settings.json` | Global settings | All projects |
> | `~/.claude/CLAUDE.md` | Global instructions | All sessions |
> | `./CLAUDE.md` | Project instructions | This project |
> | `./.claude/settings.json` | Project settings | This project |
> | `./.claude/rules/*.md` | Rule files | Auto-loaded per session |
>
> ### 8.4 The CLAUDE.md System
>
> Your CLAUDE.md is the most important file in your project. It tells Claude who you are, w
>
> **Structure of an effective CLAUDE.md:**
>
> ```markdown
> # Project Name
>
> ## Overview
> Brief project description, tech stack, purpose.
>
> ## Tech Stack
> - Framework, language, database, etc.
>
> ## Project Structure
> Directory layout with key files.
>
> ## Design Guidelines
> Colors, fonts, component patterns.
>
> ## Key Commands
> dev, build, test, deploy commands.
>
> ## Rules
> Project-specific rules and constraints.
```

© 2026 CAIO Academy

```
### 8.5 Working with Claude Code Effectively

**Best practices:**
1. **Be specific** — "Add a login button to the navbar that opens a Clerk modal" > "Add aut
2. **Give context** — Référence files, components, and patterns
3. **Let it explore** — Claude can read your codebase, don't paste code manually
4. **Use agents for complex tasks** — Spawn specialists for multi-file changes
5. **Trust the self-check** — Claude verifies its own output

---

<div class="page-break"></div>

## Module 9: MCP Servers — The Universal Connector

### 9.1 What is MCP?

MCP (Model Context Protocol) is an open standard that allows AI models to connect to extern

### 9.2 How MCP Works

> Claude Code ←→ MCP Server ←→ External Service
> ↓
> (reads/writes/executes)
**MCP provides three primitives:**
1. **Tools** — Functions the AI can call (e.g., "search_database", "send_email")
2. **Resources** — Data the AI can read (e.g., file contents, database records)
3. **Prompts** — Templates for common interactions

### 9.3 Setting Up MCP Servers

**Configuration in `~/.claude/settings.json`:**

```json
{
 "mcpServers": {
 "my-database": {
 "command": "npx",
 "args": ["-y", "@my-org/mcp-database"],
 "env": {
 "DATABASE_URL": "postgresql://..."
 }
 },
 "slack": {
 "command": "npx",
 "args": ["-y", "@composio/mcp-slack"],
 "env": {
 "COMPOSIO_API_KEY": "..."
```

© 2026 CAIO Academy
```

```
  }
  }
  }
}
> ### 9.4 Popular MCP Servers
>
> | MCP Server | Purpose | Use Case |
> |-----------|---------|----------|
> | Composio | Multi-tool integration | Connect 200+ apps |
> | Playwright | Browser automation | Testing, scraping |
> | PostgreSQL | Database access | Direct DB queries |
> | Filesystem | File operations | Cross-project file access |
> | GitHub | Repository management | Issues, PRs, code |
> | Slack | Team communication | Notifications, messages |
> | Google Drive | Document management | Read/write docs |
>
> ### 9.5 Building Custom MCP Servers
>
> When no existing MCP server fits your need, build your own:
>
> ```typescript
> import { Server } from "@modelcontextprotocol/sdk/server";
>
> const server = new Server({
> name: "my-custom-server",
> version: "1.0.0",
> });
>
> server.setRequestHandler("tools/list", async () => ({
> tools: [
> {
> name: "my_tool",
> description: "Does something useful",
> inputSchema: {
> type: "object",
> properties: {
> query: { type: "string", description: "Search query" }
> },
> required: ["query"]
> }
> }
> ]
> }));
>
> server.setRequestHandler("tools/call", async (request) => {
> if (request.params.name === "my_tool") {
> const result = await doSomethingUseful(request.params.arguments.query);
> return { content: [{ type: "text", text: JSON.stringify(result) }] };
```

© 2026 CAIO Academy

```
> }
> });
---

<div class="page-break"></div>

## Module 10: Composio — Tool Integration Platform

### 10.1 What is Composio?

Composio is a platform that provides pre-built integrations for 200+ apps. Instead of build

### 10.2 Why Composio for CAIOs

As a CAIO, your clients need their AI systems to interact with their existing tools. Compos

**Without Composio:**
> Client uses Slack + GitHub + Notion + Gmail
> → Build 4 custom integrations (40+ hours)
> → Maintain 4 différent auth flows
> → Handle 4 différent API rate limits
> **With Composio:**
> Client uses Slack + GitHub + Notion + Gmail
> → Add Composio MCP server (30 minutes)
> → One auth flow for all tools
> → Claude can use all tools natively
### 10.3 Setting Up Composio

```bash
# Install Composio CLI
npm install -g composio-core

# Add Composio MCP to Claude Code
# In ~/.claude/settings.json:
{
 "mcpServers": {
 "composio": {
 "command": "npx",
 "args": ["-y", "composio-mcp"],
 "env": {
 "COMPOSIO_API_KEY": "your-key-here"
 }
 }
 }
}
> ### 10.4 Connecting Apps
>
> ```bash
```

© 2026 CAIO Academy
```

```
> # Connect GitHub
> composio add github
>
> # Connect Slack
> composio add slack
>
> # Connect Gmail
> composio add gmail
>
> # List all connections
> composio connections list
### 10.5 Using Composio in AI Workflows

Once connected, Claude can directly:
- Send Slack messages to any channel
- Create GitHub issues and PRs
- Send emails via Gmail
- Post to LinkedIn and Twitter
- Create Notion pages
- Manage Linear tickets
- Schedule Google Calendar events

**Example workflow — Automated client reporting:**
1. Claude reads project metrics from GitHub
2. Generates a progress report
3. Sends it via Gmail to the client
4. Posts a summary in Slack
5. Creates a Notion page with the full report
6. Adds a follow-up event to Google Calendar
---

<div class="page-break"></div>

## Module 11: Skills, Hooks & Commands

### 11.1 Skills — Reusable AI Capabilities

Skills are shareable, documented instructions that make Claude perform specific tasks cons

**Anatomy of a skill:**

```markdown
---
name: deploy-to-production
description: Deploy the current project to Vercel production
---

# Deploy to Production
```

© 2026 CAIO Academy
```

```
1. Run `pnpm build` to verify the build succeeds
2. Run `vercel --prod --yes --token "$VERCEL_TOKEN"`
3. Verify the deployment is live
4. Send a Telegram notification with the URL
> **Creating skills:**
> ```bash
> # Skills live in ~/.claude/commands/ or .claude/commands/
> mkdir -p .claude/commands
### 11.2 Hooks — Event-Driven Automation

Hooks execute shell commands automatically when specific events happen in Claude Code.

**Hook types:**

| Event | Triggers When | Use Case |
|-------|---------------|----------|
| `PreToolUse` | Before a tool runs | Validation, logging |
| `PostToolUse` | After a tool completes | Notifications, tracking |
| `SessionStart` | New session begins | Load context, set environment |
| `SessionEnd` | Session ends | Save summary, cleanup |
| `UserPromptSubmit` | User sends a message | Capture prompts for analysis |

**Example hook configuration:**

```json
// .claude/settings.json
{
 "hooks": {
 "PostToolUse": [
 {
 "matcher": "Write|Edit",
 "command": "echo 'File modified: ${toolInput.file_path}' >> /tmp/claude-changes.log"
 }
 ],
 "SessionStart": [
 {
 "command": "echo 'Session started at $(date)' >> ~/.claude/sessions.log"
 }
 ]
 }
}
> ### 11.3 Commands — Custom Slash Commands
>
> Commands are user-invocable actions triggered by typing `/command-name` in Claude Code.
>
> **Creating a command:**
>
```

© 2026 CAIO Academy
```

> ```markdown
> # .claude/commands/audit.md
> ---
> name: audit
> description: Run a comprehensive code audit
> ---
>
> Perform a comprehensive audit of the current project:
>
> 1. Check for security vulnerabilities (OWASP Top 10)
> 2. Review code quality and patterns
> 3. Check test coverage
> 4. Verify deployment configuration
> 5. Generate a report in markdown format

```markdown
### 11.4 Building Your CAIO Toolkit

**Essential skills every CAIO needs:**

| Skill | Purpose |
|-------|---------|
| `/deploy` | Deploy to production |
| `/audit` | Security & code audit |
| `/blog-write` | Generate SEO blog content |
| `/test` | Run comprehensive tests |
| `/report` | Generate client reports |
| `/social-post` | Post to social media |
| `/seo-check` | Check SEO health |

---

<div class="page-break"></div>

## Module 12: Cron Systems & Automation

### 12.1 Why Cron Matters for CAIOs

Cron jobs are the heartbeat of your AI systems. They run tasks automatically on a schedule

**What you can automate:**
- Blog post génération and publishing
- Social media posting
- SEO monitoring and alerts
- Client report génération
- System health checks
- Data backups
- Content syndication

### 12.2 Cron Fundamentals
```

© 2026 CAIO Academy

```bash
# Cron syntax
# ┌─── minute (0-59)
# │ ┌─── hour (0-23)
# │ │ ┌─── day of month (1-31)
# │ │ │ ┌─── month (1-12)
# │ │ │ │ ┌─── day of week (0-7, 0=Sun)
# │ │ │ │ │
# * * * * * command

# Examples:
0 9 * * 1-5 # 9 AM every weekday
0 */6 * * * # Every 6 hours
30 2 * * * # 2:30 AM daily
0 0 1 * * # Midnight on the 1st of every month
> ### 12.3 Building Automated Content Pipelines
>
> **Example: Auto-publish blog articles**
>
> ```bash
> #!/bin/zsh
> # auto-publish.sh — Runs daily at 9 AM
>
> source ~/.claude/lib/telegram.sh
> source ~/.claude/lib/cron-preamble.sh
>
> TOPIC=$(select_next_topic)
> ARTICLE=$(claude --prompt "Write a blog article about: $TOPIC" --output json)
>
> # Generate image
> IMAGE=$(node scripts/generate-blog-image.js "$TOPIC")
>
> # Create the blog post file
> create_blog_post "$ARTICLE" "$IMAGE"
>
> # Build and deploy
> pnpm build && vercel --prod --yes --token "$VERCEL_TOKEN"
>
> # Post to social media
> node scripts/post-to-social.js "$SLUG"
>
> # Notify
> telegram notify "New blog published: $TITLE"
### 12.4 Notification Systems

Every automated system needs monitoring. We use Telegram as our notification backbone.
```

© 2026 CAIO Academy

```
**The telegram.sh library:**

```bash
#!/bin/zsh
# Load configuration
CONFIG="$HOME/.claude/config/telegram.json"
BOT_TOKEN=$(python3 -c "import json; print(json.load(open('$CONFIG'))['bot_token'])")

# Send notification
notify() {
 local message="$1"
 curl -s "https://api.telegram.org/bot$BOT_TOKEN/sendMessage" \
 -d "chat_id=$CHAT_ID" \
 -d "text=$message" \
 -d "parse_mode=HTML" > /dev/null
}
> ### 12.5 Error Handling & Recovery
>
> ```bash
> # Cron preamble — error trapping
> set -euo pipefail
> trap 'telegram notify "CRON ERROR: $0 failed at line $LINENO"' ERR
>
> # Retry logic
> retry() {
> local max_attempts=3
> local attempt=1
> while [ $attempt -le $max_attempts ]; do
> "$@" && return 0
> attempt=$((attempt + 1))
> sleep $((attempt * 5))
> done
> return 1
> }
---

<div class="page-break"></div>

## Module 13: Building SaaS with Next.js + Convex

### 13.1 The Modern SaaS Stack

| Layer | Technology | Why |
|-------|-----------|-----|
| Frontend | Next.js 16 + React 19 | Server components, App Router, fastest DX |
| Styling | Tailwind CSS v4 | Utility-first, consistent, fast |
| Components | shadcn/ui | Accessible, customizable, modern |
| Backend | Convex | Real-time, type-safe, serverless |
```

© 2026 CAIO Academy
```

```
| Auth | Clerk | Complète auth solution, webhooks |
| Payments | Stripe | Industry standard, subscriptions |
| Deployment | Vercel | Zero-config, global CDN |

### 13.2 Project Setup

```bash
# Create a new Next.js project
npx create-next-app@latest my-saas --typescript --tailwind --app

# Add Convex
npx convex dev --once # Initialize Convex

# Add shadcn/ui
npx shadcn@latest init

# Add authentication
npm install @clerk/nextjs

# Add payments
npm install stripe @stripe/stripe-js
> ### 13.3 Convex — Your Real-Time Backend
>
> Convex replaces your entire backend: database, server functions, real-time subscriptions
>
> **Schema definition:**
>
> ```typescript
> // convex/schema.ts
> import { defineSchema, defineTable } from "convex/server";
> import { v } from "convex/values";
>
> export default defineSchema({
> users: defineTable({
> clerkId: v.string(),
> email: v.string(),
> name: v.string(),
> plan: v.union(v.literal("free"), v.literal("pro"), v.literal("enterprise")),
> credits: v.number(),
> }).index("by_clerk_id", ["clerkId"]),
>
> projects: defineTable({
> userId: v.id("users"),
> name: v.string(),
> description: v.string(),
> status: v.union(v.literal("active"), v.literal("archived")),
> createdAt: v.number(),
> }).index("by_user", ["userId"]),
```

© 2026 CAIO Academy
```

```
> });
**Query functions:**

```typescript
// convex/projects.ts
import { query, mutation } from "./_generated/server";
import { v } from "convex/values";

export const list = query({
 args: { userId: v.id("users") },
 handler: async (ctx, args) => {
 return ctx.db
 .query("projects")
 .withIndex("by_user", (q) => q.eq("userId", args.userId))
 .order("desc")
 .collect();
 },
});

export const create = mutation({
 args: {
 userId: v.id("users"),
 name: v.string(),
 description: v.string(),
 },
 handler: async (ctx, args) => {
 return ctx.db.insert("projects", {
 ...args,
 status: "active",
 createdAt: Date.now(),
 });
 },
});
> ### 13.4 Real-Time UI with Convex + React
>
> ```tsx
> // app/dashboard/page.tsx
> "use client";
> import { useQuery, useMutation } from "convex/react";
> import { api } from "@/convex/_generated/api";
>
> export default function Dashboard() {
> const projects = useQuery(api.projects.list, { userId: currentUser._id });
> const createProject = useMutation(api.projects.create);
>
> return (
> <div>
> <h1>Your Projects</h1>
```

© 2026 CAIO Academy
```

```
> {projects?.map((project) => (
> <ProjectCard key={project._id} project={project} />
> ))}
> <button onClick={() => createProject({
> userId: currentUser._id,
> name: "New Project",
> description: "My new project"
> })}>
> Create Project
> </button>
> </div>
> );
> }
> **Key advantage:** Convex provides real-time updates automatically. When data changes, al

---

<div class="page-break"></div>

## Module 14: Authentication with Clerk

### 14.1 Why Clerk?

Clerk handles authentication completely: sign-up, sign-in, MFA, social login, organizations

### 14.2 Setup

```typescript
// middleware.ts
import { clerkMiddleware, createRouteMatcher } from "@clerk/nextjs/server";

const isProtectedRoute = createRouteMatcher(["/dashboard(.*)", "/api(.*)"]);

export default clerkMiddleware(async (auth, req) => {
 if (isProtectedRoute(req)) {
 await auth.protect();
 }
});
> ### 14.3 Webhook Sync with Convex
>
> ```typescript
> // app/api/webhooks/clerk/route.ts
> import { Webhook } from "svix";
> import { WebhookEvent } from "@clerk/nextjs/server";
> import { ConvexHttpClient } from "convex/browser";
> import { api } from "@/convex/_generated/api";
>
> const convex = new ConvexHttpClient(process.env.NEXT_PUBLIC_CONVEX_URL!);
```

© 2026 CAIO Academy
```

```
>
> export async function POST(req: Request) {
> const payload = await req.json();
> const headers = Object.fromEntries(req.headers);
>
> const wh = new Webhook(process.env.CLERK_WEBHOOK_SECRET!);
> const evt = wh.verify(JSON.stringify(payload), headers) as WebhookEvent;
>
> if (evt.type === "user.created") {
> await convex.mutation(api.users.create, {
> clerkId: evt.data.id,
> email: evt.data.email_addresses[0].email_address,
> name: `${evt.data.first_name} ${evt.data.last_name}`,
> plan: "free",
> credits: 100,
> });
> }
> }
---

<div class="page-break"></div>

## Module 15: Payments with Stripe

### 15.1 Subscription Architecture

> User signs up (Clerk) → Free plan →
> Clicks "Upgrade" → Stripe Checkout →
> Payment succeeds → Webhook →
> Convex updates plan → Features unlocked
### 15.2 Creating Checkout Sessions

```typescript
// app/api/stripe/checkout/route.ts
import Stripe from "stripe";

const stripe = new Stripe(process.env.STRIPE_SECRET_KEY!);

export async function POST(req: Request) {
 const { priceId, userId } = await req.json();

 const session = await stripe.checkout.sessions.create({
 mode: "subscription",
 payment_method_types: ["card"],
 line_items: [{ price: priceId, quantity: 1 }],
 success_url: `${process.env.NEXT_PUBLIC_URL}/dashboard?success=true`,
 cancel_url: `${process.env.NEXT_PUBLIC_URL}/pricing`,
 metadata: { userId },
```

© 2026 CAIO Academy
```

```
 });

 return Response.json({ url: session.url });
}
> ### 15.3 Handling Webhooks
>
> ```typescript
> // app/api/webhooks/stripe/route.ts
> import Stripe from "stripe";
>
> const stripe = new Stripe(process.env.STRIPE_SECRET_KEY!);
>
> export async function POST(req: Request) {
> const body = await req.text();
> const sig = req.headers.get("stripe-signature")!;
>
> const event = stripe.webhooks.constructEvent(
> body, sig, process.env.STRIPE_WEBHOOK_SECRET!
> );
>
> switch (event.type) {
> case "checkout.session.completed": {
> const session = event.data.object;
> // Update user plan in Convex
> await convex.mutation(api.users.updatePlan, {
> clerkId: session.metadata.userId,
> plan: "pro",
> stripeCustomerId: session.customer,
> stripeSubscriptionId: session.subscription,
> });
> break;
> }
> case "customer.subscription.deleted": {
> // Downgrade to free
> await convex.mutation(api.users.updatePlan, {
> stripeCustomerId: event.data.object.customer,
> plan: "free",
> });
> break;
> }
> }
>
> return new Response("OK");
> }
### 15.4 Customer Portal

```typescript
// Let users manage their subscription
```

© 2026 CAIO Academy
```

```
const portalSession = await stripe.billingPortal.sessions.create({
 customer: user.stripeCustomerId,
 return_url: `${process.env.NEXT_PUBLIC_URL}/dashboard`,
});
// Redirect to portalSession.url
> ---
>
> <div class="page-break"></div>
>
> ## Module 16: AI Agent Architecture
>
> ### 16.1 How Agentik {OS} Organizes 267 Agents
>
> Our agent ecosystem is organized into 6 departments:
>
> | Department | Agents | Purpose |
> |-----------|--------|---------|
> | Development | 54 | Code, components, APIs, databases |
> | Quality & Testing | 35 | E2E, unit, security, performance |
> | Security & Ops | 28 | Auth, CORS, CSRF, monitoring |
> | Marketing & Content | 28 | Blog, SEO, social, email |
> | Créative | 15 | Design, video, branding |
> | Strategy & Analytics | 32 | Research, data, pricing |
>
> ### 16.2 Agent Definition Pattern
>
> ```markdown
> # .claude/agents/react-specialist.md
> ---
> name: react-specialist
> description: React 19 expert specializing in server components
> model: opus
> tools: [Read, Write, Edit, Bash, Glob, Grep]
> ---
>
> You are a React 19 specialist. You build performant,
> maintainable React applications using:
> - Server Components (RSC)
> - Modern hooks (use, useOptimistic, useActionState)
> - Suspense boundaries
> - Error boundaries
> - Performance optimization (memo, useMemo, useCallback)
>
> Always prefer server components. Only use "use client" when
> the component needs interactivity, browser APIs, or hooks.
### 16.3 The ORACLE Routing Pattern

Every request flows through ORACLE — the brain of the system:
```

© 2026 CAIO Academy

```
> User Request → ORACLE classifies complexity →
> SIMPLE → Do it yourself
> MEDIUM → Spawn 1 specialist agent
> COMPLEX → Route to department lead
> EPIC → Full orchestration pipeline
### 16.4 Building Your Own Agent Team

Start small and grow:

1. **Week 1:** 5 core agents (dev, test, deploy, content, design)
2. **Week 2:** Add 5 specialist agents (React, DB, auth, SEO, security)
3. **Week 3:** Add orchestration (ORACLE pattern, department routing)
4. **Week 4:** Add automation (cron, hooks, monitoring)

---

<div class="page-break"></div>

## Module 17: Production Deployment & DevOps

### 17.1 The Deployment Pipeline

> Code → Build → Test → Deploy Staging → Verify → Deploy Production → Monitor
### 17.2 Vercel Deployment

```bash
# Deploy to production
vercel --prod --yes --token "$VERCEL_TOKEN"

# Preview deployment
vercel --yes --token "$VERCEL_TOKEN"

# Environment variables
vercel env add NEXT_PUBLIC_CONVEX_URL production
> ### 17.3 Monitoring & Alerting
>
> **Essential monitoring:**
>
> | What | Tool | Alert Threshold |
> |------|------|----------------|
> | Uptime | Vercel Analytics | < 99.9% |
> | Performance | Lighthouse CI | Score < 90 |
> | Errors | Sentry / console | Any uncaught |
> | SEO | Google Search Console | Drops > 10% |
> | Security | Nuclei scans | Any critical/high |
>
> ### 17.4 Automated Health Checks
```

© 2026 CAIO Academy
```

```
>
> ```bash
> #!/bin/zsh
> # health-check.sh — Runs every 30 minutes
>
> URL="https://your-site.com"
> STATUS=$(curl -s -o /dev/null -w "%{http_code}" "$URL")
>
> if [ "$STATUS" != "200" ]; then
> telegram notify "ALERT: $URL returned $STATUS"
> fi
---

<div class="page-break"></div>

# PART 3 — TOOLS ARBITRAGE

## Connect, Orchestrate & Scale AI Tools

> **Price: $497** | 7 Modules | Estimated completion: 2-3 weeks

This course teaches you the most powerful skill in the CAIO arsenal: tool arbitrage. Learn

---

<div class="page-break"></div>

## Module 18: The Arbitrage Mindset

### 18.1 What is Tool Arbitrage?

Tool arbitrage is the practice of connecting Tool A to Tool B through your AI system to cre

**Example:**
- GitHub (code changes) + Claude Code (analysis) + Slack (notification) + Linear (task trac
- Cost to client: $2K/month
- Value created: $15K/month (replaces 2 senior reviewers)
- Your margin: $13K/month

### 18.2 The Value Stack

> Raw Tool Value: $X
> + AI Integration: $3-5X
> + Automation: $5-10X
> + Orchestration: $10-20X
> = Total Value: $20-50X
### 18.3 Identifying Arbitrage Opportunities
```

© 2026 CAIO Academy

```
Ask these questions about every client:

1. What manual processes consume the most time?
2. What data exists in Tool A that should trigger actions in Tool B?
3. What decisions are made repeatedly that follow a pattern?
4. What reports are created manually every week/month?
5. Where do things fall through the cracks between tools?

---

<div class="page-break"></div>

## Module 19: High-Level Tool Connections

### 19.1 The Integration Architecture

> Data Source → AI Processing Layer → Action Layer → Monitoring Layer
> (GitHub, (Claude Code, (Slack, (Telegram,
> Gmail, custom agents) Linear, Grafana)
> Notion) Stripe)
### 19.2 Common Integration Patterns

| Pattern | Source → AI → Destination | Use Case |
|---------|---------------------------|----------|
| Code Review | GitHub PR → Claude → Slack | Automated code review |
| Content Pipeline | Research → Claude → Blog + Social | Content marketing |
| Lead Scoring | Form → Claude → CRM + Email | Sales automation |
| Bug Triage | Error logs → Claude → Linear + Slack | Incident management |
| Client Reporting | Analytics → Claude → Email + Notion | Account management |
| Invoice Processing | Email → Claude → Accounting | Finance automation |

### 19.3 Setting Up Cross-Tool Pipelines

**Example: Automated content pipeline**

1. Cron triggers at 9 AM
2. Claude Code generates blog article
3. Gemini generates featured image
4. Next.js build deploys the article
5. Composio posts to LinkedIn
6. Composio posts to Twitter
7. Composio posts to Reddit
8. Telegram notifies the team
9. Google Analytics tracks performance
Each step uses a différent tool, orchestrated by your AI system. The client sees magic. You

### 19.4 Authentication & Security
```

© 2026 CAIO Academy

```
**Best practices for multi-tool connections:**
- Store all credentials in environment variables or secret managers
- Use OAuth where possible (never store plain passwords)
- Implement least-privilege access (only grant permissions needed)
- Rotate API keys quarterly
- Monitor for anomalous usage patterns

---

<div class="page-break"></div>

## Module 20: Building Custom Pipelines

### 20.1 Pipeline Architecture

Every pipeline follows this structure:

```typescript
interface Pipeline {
 trigger: "cron" | "webhook" | "manual" | "event";
 steps: PipelineStep[];
 errorHandler: (error: Error) => void;
 notifications: NotificationConfig;
}

interface PipelineStep {
 name: string;
 tool: string; // Which tool to use
 action: string; // What to do
 input: any; // From previous step
 retries: number; // How many times to retry
 timeout: number; // Max execution time
}
> ### 20.2 Real Pipeline Examples
>
> **Pipeline 1: Client Onboarding**
Trigger: Stripe payment webhook
→ Create Convex user record
→ Set up GitHub repository
→ Configure Vercel project
→ Send welcome email via Gmail
→ Create onboarding tasks in Linear
→ Schedule kickoff call in Google Calendar
→ Notify team in Slack
→ Add to Telegram group
> **Pipeline 2: Weekly SEO Monitoring**
Trigger: Cron every Monday at 8 AM
→ Fetch Google Search Console data
```

© 2026 CAIO Academy
```

```
→ Analyze ranking changes
→ Check competitors with DataForSEO
→ Generate improvement recommendations
→ Create blog post outlines for opportunities
→ Email report to client
→ Create Linear tasks for fixes
> **Pipeline 3: Automated Bug Fixing**
Trigger: Sentry error alert webhook
→ Fetch error details and stack trace
→ Claude Code analyzes the bug
→ Claude Code creates a fix
→ Run tests to verify
→ Create PR with fix
→ Notify team in Slack
→ Close the Sentry issue
> ### 20.3 Error Handling in Pipelines
>
> ```bash
> # Pipeline error handling pattern
> run_pipeline_step() {
> local step_name="$1"
> local command="$2"
> local max_retries="${3:-3}"
>
> for attempt in $(seq 1 $max_retries); do
> if eval "$command"; then
> log "[$step_name] Success (attempt $attempt)"
> return 0
> fi
> log "[$step_name] Failed (attempt $attempt/$max_retries)"
> sleep $((attempt * 5))
> done
>
> telegram notify "Pipeline step failed: $step_name after $max_retries attempts"
> return 1
> }
---

<div class="page-break"></div>

## Module 21: Multi-Agent Orchestration

### 21.1 Why Multi-Agent?

Single agents are powerful. Teams of agents are unstoppable.

| Approach | Speed | Quality | Complexity |
|----------|-------|---------|------------|
```

© 2026 CAIO Academy

```
| Single agent | 1x | Good | Low |
| Sequential agents | 2-3x | Better | Medium |
| Parallel agents | 5-10x | Best | High |

### 21.2 Orchestration Patterns

**Pattern 1: Hub and Spoke**
> Agent A (dev)
> ↑
> ORACLE → Agent B (test) → Merge results
> ↓
> Agent C (docs)
> **Pattern 2: Pipeline**
> Agent A (research) → Agent B (write) → Agent C (edit) → Agent D (publish)
> **Pattern 3: Consensus**
> Agent A reviews code →
> Agent B reviews code → → Merge reviews → Final decision
> Agent C reviews code →
### 21.3 Implementing Multi-Agent in Claude Code

```markdown
# When spawning parallel agents:
Agent(
 subagent_type="react-specialist",
 prompt="Build the dashboard component...",
 run_in_background=True,
 mode="bypassPermissions"
)

Agent(
 subagent_type="test-automator",
 prompt="Write tests for the dashboard...",
 run_in_background=True,
 mode="bypassPermissions"
)
> ### 21.4 Context Engineering
>
> The key to multi-agent success is **context engineering** — giving each agent exactly the
>
> **Rules:**
> 1. Each agent gets a fresh context (no stale state)
> 2. Pre-inline all relevant decisions and context
> 3. Include file ownership boundaries (prevent conflicts)
> 4. Provide clear success criteria
> 5. Set up merge/integration points
>
> ---
>
```

© 2026 CAIO Academy
```

```
> <div class="page-break"></div>
>
> ## Module 22: Monitoring & Self-Healing Systems
>
> ### 22.1 The Monitoring Stack
>
> | Layer | What to Monitor | Tool |
> |-------|----------------|------|
> | Application | Errors, latency, uptime | Sentry, Vercel Analytics |
> | Infrastructure | CPU, memory, disk | VPS monitoring |
> | Business | Revenue, signups, churn | Convex + custom dashboards |
> | Content | SEO rankings, traffic | Google Search Console |
> | Security | Vulnerabilities, threats | Nuclei, OWASP ZAP |
>
> ### 22.2 Self-Healing Patterns
>
> **Auto-restart on failure:**
> ```bash
> #!/bin/zsh
> # monitor-and-heal.sh
> SERVICE_URL="https://api.example.com/health"
> STATUS=$(curl -s -o /dev/null -w "%{http_code}" "$SERVICE_URL")
>
> if [ "$STATUS" != "200" ]; then
> # Attempt auto-heal
> vercel --prod --yes --token "$VERCEL_TOKEN" 2>/dev/null
>
> # Verify heal worked
> sleep 30
> NEW_STATUS=$(curl -s -o /dev/null -w "%{http_code}" "$SERVICE_URL")
>
> if [ "$NEW_STATUS" != "200" ]; then
> telegram notify "CRITICAL: $SERVICE_URL still down after redeploy"
> else
> telegram notify "Auto-healed: $SERVICE_URL restored via redeploy"
> fi
> fi
> ### 22.3 Building a Notification System

> Event occurs → Classify severity → Route notification
>
> CRITICAL → Immédiate Telegram + SMS
> HIGH → Telegram within 5 min
> MEDIUM → Daily digest email
> LOW → Weekly summary
---

<div class="page-break"></div>
```

© 2026 CAIO Academy

```
## Module 23: Client Delivery Framework

### 23.1 The CAIO Delivery Process

> Week 1: Audit & Architecture
> → Map current systems
> → Identify AI opportunities
> → Design integration architecture
> → Get client approval
>
> Week 2-3: Build & Integrate
> → Set up AI pipelines
> → Connect existing tools
> → Build custom automations
> → Test everything
>
> Week 4: Deploy & Train
> → Deploy to production
> → Train client team
> → Set up monitoring
> → Hand over documentation
>
> Ongoing: Monitor & Improve
> → Monthly performance reviews
> → Continuous optimization
> → New automation proposals
> → Strategic AI guidance
### 23.2 Documentation Template

Every client delivery includes:

1. **System Architecture Document** — How everything connects
2. **Runbook** — How to operate the system day-to-day
3. **Troubleshooting Guide** — Common issues and fixes
4. **API Référence** — All endpoints and integrations
5. **Training Video** — Walkthrough of the entire system

### 23.3 Handoff Checklist

- [ ] All credentials in client's password manager
- [ ] GitHub repository transferred to client
- [ ] Vercel project under client's account
- [ ] Convex deployment under client's account
- [ ] Stripe connected to client's bank account
- [ ] Domain DNS properly configured
- [ ] Monitoring alerts pointing to client's channels
- [ ] Documentation complète and reviewed
```

© 2026 CAIO Academy

```
- [ ] Training session completed
- [ ] Support period begins

---

<div class="page-break"></div>

## Module 24: Scaling Your AI Business

### 24.1 Revenue Targets

| Phase | Clients | Monthly Revenue | Timeline |
|-------|---------|----------------|----------|
| Launch | 1-2 | $5-15K | Months 1-3 |
| Growth | 3-5 | $20-50K | Months 4-8 |
| Scale | 5-10 | $50-100K | Months 9-18 |
| Agency | 10-20 | $100-250K | Year 2+ |

### 24.2 The Product Ladder

> Free Content (blog, YouTube, Telegram)
> ↓ Converts to
> Training Courses ($497-997)
> ↓ Converts to
> AI Audit ($3-7K)
> ↓ Converts to
> AI Build ($15-45K)
> ↓ Converts to
> CAIO Partnership ($4-15K/month)
> ↓ Converts to
> Equity Deals (10-15% of startup)
### 24.3 Building Your Community

**The Agentik model:**
- Free Telegram channel (tips, insights, networking)
- Pro membership (67 EUR/month — full access, skills, tools)
- Course bundle ($997 — complète CAIO training)
- 33% affiliate commissions
- 70% early bird discount on future products

### 24.4 Automation is Your Superpower

The irony of being a CAIO: you automate your own business too.

**What to automate in your own practice:**
- Content création (blog + social media pipeline)
- Lead nurturing (email sequences)
- Client onboarding (automated setup)
```

© 2026 CAIO Academy

```
- Reporting (automated monthly reports)
- Invoicing (Stripe automatic billing)
- Support (AI-powered help desk)

---

<div class="page-break"></div>

# APPENDIX A: Complète Tool Référence

## Essential CAIO Toolkit

| Category | Tool | Purpose | Monthly Cost |
|----------|------|---------|-------------|
| **AI Models** | Claude (Anthropic) | Primary AI engine | $20-200 |
| | GPT-4 (OpenAI) | Secondary/comparison | $20-200 |
| | Gemini (Google) | Image génération | $0-50 |
| **Development** | Claude Code | AI coding assistant | Included w/ Claude |
| | VS Code / Cursor | Code editor | Free-$20 |
| | GitHub | Version control | Free-$4 |
| **Backend** | Convex | Real-time database | Free-$25 |
| | Vercel | Deployment | Free-$20 |
| **Auth & Payments** | Clerk | Authentication | Free-$25 |
| | Stripe | Payments | Pay-per-use |
| **Integration** | Composio | Tool connections | Free-$30 |
| | MCP servers | Custom connections | Free |
| **Monitoring** | Telegram Bot | Notifications | Free |
| | Google Search Console | SEO tracking | Free |
| | Sentry | Error tracking | Free-$26 |
| **Content** | Gemini Imagen | Image génération | $0-50 |
| | md-to-pdf | Document génération | Free |

**Total monthly cost to run a CAIO practice: $80-600**

---

<div class="page-break"></div>

# APPENDIX B: CAIO Business Templates

## Discovery Call Script

1. "Tell me about [Company] — what do you do and who do you serve?"
2. "What does your tech/operations team look like today?"
3. "What are you spending annually on [development/marketing/ops]?"
4. "What's your biggest bottleneck right now?"
5. "If you could automate one thing tomorrow, what would it be?"
6. "What would solving this problem mean for your business in 6 months?"
```

© 2026 CAIO Academy

```
7. "Have you explored AI solutions before? What happened?"
8. "We have three ways to work together: [explain tiers].
Based on what you've told me, I'd recommend starting with [X]."
9. "Shall I send you a proposal? I can have it to you by [tomorrow]."
## Proposal Template

> # AI Systems Proposal for [Company Name]
>
> ## Executive Summary
> [2-3 sentences on what you'll do and the expected ROI]
>
> ## Current State
> [What they have now — team, tools, costs]
>
> ## Proposed Solution
> [What you'll build — systems, integrations, automations]
>
> ## Investment
> [Pricing — always three options]
>
> ## Timeline
> [Week-by-week delivery plan]
>
> ## Expected ROI
> [Specific cost savings and efficiency gains]
>
> ## Next Steps
> [How to get started — sign, pay, kick off]
> ## Monthly Report Template

> # Monthly AI Systems Report — [Month Year]
>
> ## Key Metrics
> - Tasks automated: [X]
> - Time saved: [X hours]
> - Cost savings: $[X]
> - System uptime: [X]%
> - Issues resolved: [X]
